Abstract

Among the ancient Indian Sciences, Astronomy and Mathematics occupy a prime position along with the Sciences of Language and Health. All these Sciences are distinguished by an extensive textual tradition which goes back to the Vedic period and the tradition continued to flourish till at least the middle of the nineteenth century. A large part of the great manuscript wealth of India pertains to these and other sciences and technologies, which have played a crucial role in the history of our civilisation.

Unlike in the case of other ancient sciences, the vast corpus of manuscripts in Astronomy and Mathematics has been extensively surveyed and documented during the last fifty years, mainly due to the painstaking efforts of the eminent scholars Samarendra Nath Sen (1918-1992), Krishna Venkateswara Sarma (1919-2006) and David Pingree (1933-2005). We shall make use of their documentation to present (i) an estimate of the vast corpus of source-works in Indian Astronomy and Mathematics, and (ii) an assessment of what has been accomplished by modern scholarship over the last two centuries by way of editing and translating some of these source-works with a view to comprehend and elucidate their technical (mathematical-astronomical) content.

We find that of the estimated 9,000 source-works of Indian Astronomy and Mathematics (which are preserved in around 30,000 manuscripts), only about 150 texts were edited, and just about 30 texts translated during 1800-1947. During the last seventy years, another 300 texts have been edited and 66 texts have been translated, many of them with detailed explanatory notes.

While significant progress has been achieved by the modern scholarship in Indian Astronomy and Mathematics during the last seventy years, we are as yet far from achieving a comprehensive understanding of the fundamental concepts and techniques, theories and methodologies and even the historical development of Indian Astronomy and Mathematics. This is mainly because:

1. Only 450 (or 5%) of the estimated 9,000 source-texts (which are available in manuscript form) have been edited and published so far.
2. Further, even among the 450 or so published works, only about 96 texts been seriously studied and explicated via translations and explanatory commentaries with a view to bring out their technical (mathematical-astronomical) content.
3. Most of these editions and studies have been brought out during the last seventy years or so; and this is largely due to the voluntary and dedicated efforts of a number of Indian scholars, as there has been little scope or support for such work in our institutions of higher learning.

There is thus an urgent need to reorient our national priorities and give due importance to the Preservation, Digitization, Listing and Cataloguing, Editing & Publishing, and Promoting Systematic Studies of the large corpus of source-works of the great tradition of Science and Technology in India. Training young scholars for undertaking all these tasks should indeed form an integral part of the courses and research conducted in our institutions of higher learning.
I. Estimates of the Manuscript Wealth of India

The first systematic survey of catalogues of Indian manuscripts in various repositories was published by Klaus Janert in 1965, where he estimated that the total number of Indian manuscripts could be more than one million:¹

We have reason to suppose that more than one million of Indian manuscripts are deposited in libraries, public or private and that more than 600,000 different manuscripts have been listed in some manner in printed catalogues since the origin of Indian studies a century and a half ago.

Janert also noted that:²

The present ... Annotated Bibliography of Catalogues of Indian Manuscripts contains 339 titles of publications comprising approximately 700 separate volumes, parts or fascicles with a total of nearly 185,000 pages and about 550,000 catalogue entries of Indian manuscripts 500,000 of which were catalogues or listed in India.

As of date, the most comprehensive survey of the catalogues of Indian manuscripts is the one published by Subhash Biswas and M. K. Prajapati in 1998, and they estimated the total number of Indian manuscripts to be around 3.5 million, of which only about a million had been catalogued:³

There are some 3.5 million manuscripts in various collections in India. In addition about 60,000 Indian manuscripts are preserved in 20 different countries of Europe and North America. Several other countries in Asia also have nearly 150,000 manuscripts in Indian scripts and languages. ...

Only about one million manuscripts have been recorded in published catalogues or hand lists brought out by libraries and institutions. It was also found that several private and institutional collections remained unattended for years, without even being recorded or listed in any form. These one million manuscripts have been listed in about 2,000 volumes of catalogues published till about 1990; out of these nearly 300 were published by overseas institutions.

Biswas and Prajapati also presented the language-wise distribution of the catalogued manuscripts, which is given in Table 1:⁴

² Ibid. p. 9 fn.
⁴ Ibid. p. xx.
In September 1998, while announcing the proposal to establish a National Mission for Manuscripts, the Press Information Bureau Report mentioned that there were around 30 million Indian manuscripts:\(^5\)

A national mission is being set up for the preservation of hundreds and lakhs of manuscripts scattered all over the country. ... The mission is to be launched in three phases. The first phase will comprise compilation and publication of a directory of institutions/individuals possessing these manuscripts and collecting data on their historical importance and physical state and preservation facilities available. The second phase envisages analysis of the data collected in the first phase and physical verification and preparation of a national register of these manuscripts, which have national and international importance. The third stage will be digitalisation of these rare manuscripts in order to increase accessibility without physical handling.

More than 30 million manuscripts remain scattered all over the country. The Minister for Human Resource Development, Dr. Murli Manohar Joshi while chairing a meeting of the Advisory Board of National Library recently, expressed concern over this and said that to protect these, which are our cultural heritage, a national mission for their preservation must be set up.

In a review article on 'Indian Manuscripts' (written in 2011 and published in 2014) Dominik Wujastyk also concurred with this estimate of 30 million manuscripts – which, he notes, was also the estimate made by David Pingree:\(^6\)

---

\(^6\) D. Wujastyk, 'Indian Manuscripts', in J. B. Quenzer Ed. *Manuscript Cultures Mapping the Field*, De Gruyter, Berlin 2014, pp. 159-160. The figure of 30 million Indian manuscripts is also mentioned by Sheldon Pollock who contrasts it with the total of about 30,000 Greek manuscripts (covering the classical, Hellenistic and Byzantine periods) which are extant (S. Pollock, *The Language of Gods in the World of Men*, University of California Press, Berkeley 2006, p. 558 & fn).
How many Indian manuscripts are there? The National Mission for Manuscripts in New Delhi works with a conservative figure of seven million manuscripts, and its database is approaching two million records ([http://www.namami.org/manuscriptdatabase.htm](http://www.namami.org/manuscriptdatabase.htm), consulted 18 August 2011). The late Prof. David Pingree, basing his count on a lifetime of academic engagement with Indian manuscripts, estimated that there were thirty million manuscripts, if one counted both those in public and government libraries, and those in private collections (David Pingree, personal communication in the 1990s). For anyone coming to Indian studies from another field, these gargantuan figures are scarcely credible. But after some acquaintance with the subject, and visits to manuscript libraries in India, it becomes clear that these very large figures are wholly justified. The Jaina manuscript library at Koba in Gujarat, which only started publishing its catalogues in 2003, has an estimated 250,000 manuscripts. The Sarasvati Bhavan Library in Benares has in excess of 100,000 manuscripts. There are 85,000 in various repositories in Delhi. There are about 50,000 manuscripts in the Sarasvati Mahal library in Thanjavur in the far South. Such examples are easily multiplied across the whole subcontinent. And these are only the public libraries with published catalogues. A one-year pilot field-survey by the National Mission for Manuscripts in Delhi, during 2004-2005, documented 650,000 manuscripts distributed across 35,000 repositories in the states of Orissa, Bihar and Uttar Pradesh, and field participants in that project report that they only scratched the surface. ...

The National Manuscripts Mission gives a more modest estimate of 10 million Indian manuscripts on its current webpage:7

The National Mission for Manuscripts was established in February 2003, by the Ministry of Tourism and Culture, Government of India. A unique project in its programme and mandate, the Mission seeks to unearth and preserve the vast manuscript wealth of India. India possesses an estimate of ten million manuscripts, probably the largest collection in the world.

The Mission also gives the following summary of its performance so far, which mentions that over 4.2 million manuscripts have been documented:8

- 42.03 lakhs Manuscripts have been documented.
- Set up a web-based National Database of Manuscripts with information on 2.7 million manuscripts.
- 1st, 2nd and 3rd Phase of the Digitization of manuscripts project is completed and 4th phase is in process. Total 2.96 lakhs manuscripts (2.61 Crore Pages) have been digitized.
- Initiated a Publication Programme. 30 unpublished Manuscripts have been published.

Given the results of the surveys done by the NMM so far, it does seem that 10 million is indeed a reasonable estimate for the number of Indian manuscripts that are extant; of these, perhaps only about 2 to 3 lakhs are in repositories outside India. Again, the number of manuscripts in Sanskrit can be expected to be of the order of 8 million.

---

II. The Distribution of Manuscripts over Different Disciplines

*Catalogus Catalogorum and the New Catalogus Catalogorum*

Many of the descriptive catalogues published by different manuscript repositories list the manuscripts in different disciplines separately; some of them may mention the discipline along with the title of each text, while listing its manuscripts. To make any assessment of the extent of manuscripts in different disciplines, what is required is to systematically compile the information provided in various catalogues into some sort of a 'union catalogue' which lists all the works along with various details such as the author, discipline, etc., provided in the individual catalogues.

The first such compilation was made by Theodor Aufrecht in his *Catalogus Catalogorum*, which was published in three volumes during 1891-1903.9 Aufrecht’s work was based on 94 catalogues and his first volume listed about 60,000 works and authors alphabetically, with appropriate catalogue references.

In 1935, the University of Madras initiated a programme of updating the Aufrecht’s work, as many more catalogues had become available by then. A provisional fasciculus of the *New Catalogus Catalogorum* (NCC) was issued under the editorship of S. Kuppuswami Sastri in 1937. The first Volume (covering the letter 'a') appeared in 1949 under the editorship of C. Kunhan Raja with the assistance of V. Raghavan. In the 1950s the work got intensified and two Research Assistants (K. V. Sarma and C. S Sundaram) were appointed to assist Raghavan. During 1966-69, a revised edition of Volume I was published along with Volumes II-IV (covering 'a' to 'gā') under the editorship of V. Raghavan. Volumes VI-XI (covering 'gā' to 'pa') were published during 1971-83 under the editorship of K. Kunjunni Raja. Volumes XII-XIV (covering 'pa' to 'bra') were published during 1988-2001 under the editorship of N. Veezhinathan. And, Volumes XV-XXXIX (covering 'bra' to 'su') have been published during 2007-15 under the editorship of Siniruddha Dash. The remaining couple of volumes are expected to be published shortly.

The Volumes I-XIV present manuscript references and other details based on around 400 Catalogues and a large number of secondary sources. Volumes XV-XXXIX have compiled details from over 900 Catalogues along with the secondary sources. It may be estimated that, when completed, the entire series of volumes of NCC will have information on over 300,000 works and authors. The works have been classified under various subject heads which is reproduced in Table 2.

An estimate of the extent of manuscript wealth in any discipline can be had by compiling the entries in various volumes of NCC that come under each subject category/categories. Such an analysis is yet to be undertaken.

---

As regards the wealth of manuscripts in different disciplines, there is detailed information available only for the case of Tamil Manuscripts. In 1991, the Tamil University Thanjavur, published a five volume Union Catalogue of 21,973 Tamil Manuscripts listed in various published catalogues from 17 Indian repositories (holding 20,804 manuscripts) and 22 Repositories abroad (holding 1,169 manuscripts). The last of these volumes gives a bibliometric analysis of about 21,875 manuscripts whose subjects could be identified among a list of about 330 subject-headings. The subject-wise distribution of Tamil manuscripts given in Table 3, has been worked out on the basis of this bibliometric analysis.10

From Table 3, we can see that religion, philosophy and other humanities and social sciences, account for about 41.5% of the Tamil manuscripts; literature accounts for another 30% of the manuscripts. The rest, which constitute about 28.5% of the manuscripts are in various sciences – including the science of language which accounts for nearly 6% of the manuscripts. About 3,350 manuscripts (constituting 15.31% of the total) deal with medicine and about 1,250 manuscripts (5.71% of the total) are said to deal with Astrology. It is reported that there are about 120 manuscripts each on Astronomy and Mathematics and Chemistry, 100 on architecture and 40 on Chemistry.

Survey of Sanskrit Manuscripts on Science in Kerala and Tamil Nadu by K. V. Sarma

During 1995-97, K. V. Sarma did a painstaking survey of 247 manuscript repositories in Kerala and 147 manuscript repositories in Tamil Nadu. During the course of this survey, about 150,000 manuscripts were examined partly in situ in person and partly through their catalogues or hand-lists when available. The Survey revealed that of the total of 150,000 manuscripts surveyed, 12,244 manuscripts (more than 8%) pertained to various sciences including Astrology, Astronomy & Mathematics, Medicine, Architecture, Musicology, Chemistry, Veterinary Science and Agriculture.

Table 4: Subject-wise distribution of Sanskrit manuscripts in Science in Kerala and Tamil Nadu

The manuscripts on Astrology, Astronomy and Mathematics together accounted for 11,000 (or 90%) of the manuscripts pertaining to Science. However, unlike in the case of the Tamil manuscripts, the Sanskrit manuscripts on Astronomy and Mathematics constituted a much larger proportion (nearly 25% of the manuscripts on Science, and 30% of the manuscripts in Jyotisha) while the Sanskrit manuscripts on Medicine were only 10% of the total Sanskrit manuscripts on Science. Sarma’s survey also found that these 12,244 manuscripts actually correspond to about 3,473 separate texts, of which only 229 or about 6.6% of these texts had been edited and published so far. In table 4, we have summarised the discipline-wise distribution of manuscripts and texts as found in the survey:12

III. Manu scripts and Source-works in Astronomy and Mathematics

Among the ancient Indian Sciences, Astronomy and Mathematics occupy a prime position along with the Sciences of Language and Health. All these Sciences are distinguished by an extensive textual tradition which goes back to the Vedic period and the tradition continued to flourish till at least the middle of the nineteenth century. As we saw above, a significant part of the great manuscript wealth of India pertains to these sciences, which have played an important role in the history of our civilisation.

Unlike in the case of other ancient sciences, the vast corpus of manuscripts in Astronomy and Mathematics has been extensively surveyed and documented by modern scholarship during the last fifty years. One of the earliest surveys of the manuscripts in Astronomy and Mathematics was conducted in early 1960s at the behest of the National Institute of Sciences of India (later named the Indian National Science Academy) by Samarendra Nath Sen with the assistance of Amulya Kumar Bag and Sreeramula Rajeswara Sarma.13 Their Bibliography was based on information compiled from 79 catalogues and listed 660 works under 480 authors, together with another 320 works whose authors were not known. For each title, catalogue references were provided to the manuscripts, along with other details, wherever available. Since the information compiled was based only on 79 catalogues, this Bibliography should be considered as a preliminary survey of the vast corpus of manuscripts in the field of Astronomy and Mathematics.

A comprehensive survey of the manuscripts and source-works on Indian Astronomy and Mathematics was undertaken by David Pingree. Pingree, it seems, embarked on this mammoth enterprise in 1955, and he was still working on it at the time of his demise in 2005. Five volumes of Pingree’s Census of Exact Sciences in Sanskrit (covering all authors from 'a' to 'va', in about 1,700 pages) appeared during 1970-1994.14 The scope of the Census is outlined in the introduction to the first Volume:15

... Census of the Exact Sciences in Sanskrit (hereafter to be referred to as CESS)... will provide all available bibliographical information concerning works in jyotishāstra and related fields and biographical information concerning their authors. Jyotishāstra is divided into three skandhas or branches: hora or genethlialogy and other forms of horoscopic astrology, ganita or mathematics

---

12Ibid.
and mathematical astronomy, and sañhitā or divination. The related fields to which attention is paid in CESS are cosmology and geography (largely of the Jainas) and those aspects of dharmāṣṭra that involve the determination of the proper times for the performance of ritual acts. It is intended to include all the works and all the authors in these subjects that can be identified.

CESS will consist of two series: Series A will contain articles on authors arranged in the order of Sanskrit alphabet, and the Series B articles on the Books (mainly in Sanskrit, though some non-Sanskritic material is included arranged in the same manner ...The article on each author will first give as much information as is available on his date, ancestry, locale, religious affiliation, and social position; it will then list his works relevant to jyotiḥśāstra, and, under each work, list its commentators, its manuscripts and editions, and any discussions of it; finally there will be given a table of its contents and those passages in it which inform us about the author. ... 

In the preface to the same volume, Pingree mentions that:16

... the individual to whom this cataloguer owes most is India’s foremost student of Sanskrit manuscripts, Professor V. Raghavan of the University of Madras, who most generously made available his numerous handwritten catalogues of Indian and European collections. May this work prove as useful to the students of jyotiḥśāstra as Raghavan’s New Catalogous Catalogorum is to the students of Sanskrit literature in general.

Around 400 catalogues are listed in the first Volume of the Census. Supplementary lists are given in each successive Volume so that the total number of catalogues from which the information has been compiled adds up to around 600. The Volumes of the Census also present a comprehensive bibliography of secondary sources – listing over 2,000 articles and books related to jyotiḥśāstra.

The first four Volumes of the Census (covering letters ‘a’ to ’ma’) included information on 2,450 authors in all. The corresponding information in the case of Volume V (covering letters ‘ya’ to ‘va’) was not provided. It is estimated that, when the contents of the unpublished sixth Volume is also taken into account, the total number of authors could be more than 4,000.

The Volumes of the Census constitute a rich source for studying all aspects of the large corpus of manuscripts in jyotiḥśāstra such as: The total number of manuscripts, the total number of source-works and their distribution over different sub-disciplines and the historical periods and locations of the authors, details of source-works which have been edited, translated and studied, and so on. Such studies have not been carried out so far – perhaps because, like in the case of NCC, the Volumes of the Census are not yet complete.

In his survey of the literature on jyotiḥśāstra, published in 1981, Pingree himself estimated the total number of Sanskrit manuscripts pertaining to jyotiḥśāstra to be around 100,000:17

At present there exist in India and outside of it some 100,000 manuscripts on the various aspects of jyotiḥśāstra. The great majority of these were copied within the seventeenth,
eighteenth, and nineteenth centuries; for manuscripts cannot long survive in India except under exceptional circumstances.

We may now recall the findings of the Survey of Sanskrit manuscripts in Kerala and Tamil Nadu, due to K. V. Sarma (mentioned earlier), that there are 6,714 manuscripts (corresponding to 1572 works) on Astrology and 2,919 manuscripts (corresponding to 934 works) in Astronomy and Mathematics. Hence, we can conclude that out of about 100,000 manuscripts on jyotihşāstra, the number of manuscripts pertaining to Astronomy and Mathematics could be around 30,000. Again, using the result of the same survey, we can also conclude that these 30,000 manuscripts are associated with roughly around 9,000 source-works on Astronomy and Mathematics in Sanskrit. This is indeed a huge wealth of literature, much of which (as we shall see below) remains untapped so far.

Apart from the Bibliography of Sen and the five Volumes of the Census and the monograph on the literature on jyotihşāstra due to Pingree (cited above), the other important sources which provide us valuable information regarding the source-works in Indian Astronomy and Mathematics (and details regarding their published editions, translations, etc.), are the following:

(i) Two monographs on Sanskrit Astronomical Tables in America and England by Pingree.18
(ii) The seminal bibliography of the works of Kerala School of Astronomers by K. V. Sarma.19
(iii) The survey of K. V. Sarma on the Science Texts in the Manuscript Repositories of Kerala and Tamil Nadu (cited above)

Here, we shall essentially make use of the above sources to assess the progress achieved by modern scholarship of the last two and a half centuries in comprehending the Indian tradition of Astronomy and Mathematics by studying, editing, translating and analysing the technical contents of the large corpus of nearly 9,000 source-works as estimated above.

IV. Modern Scholarship in Indian Astronomy and Mathematics: An Assessment of its Progress over the last Two and a Half Centuries

The Indian tradition of Astronomy and Mathematics was fairly flourishing during the eighteenth century and, in several parts of the country the tradition continued well into the middle of the nineteenth century. However, the British policy of stopping all allocations for the support of indigenous learning (both by the local village societies as well as by the former Indian rulers), coupled with the policy of exclusively reserving all Governmental jobs to those who were trained in the new English education system, led to a steep decline in indigenous learning during the course of the nineteenth century.

We shall here focus on the growth of modern scholarship – the modern phase of the European scholarship – in Indian Astronomy and Mathematics which may be said to have been initiated in the second half of the eighteenth century by the British and European scholars (and the British administrators in India). In the initial period, most of the investigations were confined to the analysis and interpretation of Indian astronomical tables which had been transmitted to Europe from India (and

---

even Southeast Asia) during the course of the seventeenth and eighteenth centuries. More systematic studies of the source-works of Indian Astronomy and Mathematics began in the 1780s, some of which were published in the journal *Asiatic Researches* brought out by the Asiatic Society, established in Calcutta in 1784.

**Source-works in Indian Astronomy and Mathematics Edited/Translated During 1800-1875**

To start with, we consider the source-works which were edited/translated during the period 1800-1875. The first full-fledged translations of Indian Mathematics texts appeared during the decade, 1810-1820, starting with the translation of *Bījaganita* and *Lilāvatī* of Bhāskarācārya (c.1150), by E. Strachey and J. Taylor in 1813 and 1816. This was soon followed in 1817 by a more authoritative translation, along with detailed explanation of the mathematical content of these works (based on an examination of their traditional commentaries), by Henry Thomas Colebrooke. Colebrooke’s work also included a translation of the Gaṇita and Kuṭṭaka chapters of the *Brāhmaśphutasiddhānta* of Brahmagupta (c.628). In the meanwhile, there also appeared a brief translation, due to Benjamin Hyne, of the Geometry section of the Telugu work, *Pāvalīri Gaṇitamu* (which is said to be a translation of *Gaṇitasārasaṅgraha* of Mahāvīra (c.850)), by Mallāṇa (c.1100). However, for the next several decades, there seems to have been little progress in the translation of source-texts of Indian Mathematics, till George Thibaut took up the study of the *Śulvasūtras* in the 1870s.

Editions of Indian source-works started appearing in the 1830s. Here again, the Sanskrit texts of *Lilāvatī* and *Bījaganita* of Bhāskarācārya were the first to be published from Calcutta in 1832 and 1834. The British administrator Lancelot Wilkinson had gathered a group of traditional Indian scholars at Sehore and he published an edition of the celebrated treatise, *Siddhāntasiromani* of Bhāskarācārya, along with the auto-commentary *Vāsanābhaṣya*, from Calcutta in 1842. In the next year, Wilkinson published an edition of the famous Astronomical manual (*karaṇa*) *Grahalāghava* of Gaṇeśa Daivajña (c.1520) along with the commentary of Mallārī (c.1588). In 1859, Fritz Edward Hall and Bāpū Deva Śāstri (the doyen among traditional scholars, who had also been trained in modern learning in the Sanskrit College of Varanasi) published an edition of the *Sūryasiddhānta* along with the commentary *Gūḍhārthapraṇāśaka* of Raṅganātha (c.1603) as a part of the Bibliotheca Indica series from Calcutta. Another major publication in this series was the edition by H. Kern of the famous *Bṛhatsaṁhitā* of Varāhamihira (c.550). But the crowning achievement of this period was the publication from Leiden of an edition of the seminal text of Indian Astronomy – the *Āryabhāṭiya* of Āryabhaṭa (c.499), along with the commentary *Bhaṭṭāripikā* of the famous Kerala Astronomer Parameśvara (c.1430), by H. Kern in 1874.

As regards translations of source-works of Indian Astronomy, a Marathi translation of the *Siddhāntasiromani* was published in 1837. In 1848, H. R. Hoisington of the Batticotta Seminary in Sri Lanka published an edition and translation (along with explanatory notes) of the popular work of the Vākya system, *Ciḍāmani Uṭṭamaṇḍalāyin* (in Tamil) of Tirukkoṭṭiyur Nambi (c.1234). However, unlike the work of Colebrooke on Indian Mathematics which was published in 1817, the first detailed exposition in English of a classical Siddhāntic text of Indian Astronomy appeared only in 1860. This was the famous translation of *Sūryasiddhānta* (together with detailed explanatory notes) by

---

Rev. Ebenezer Burgess, which was revised by William Dwight Whitney. Soon, this was followed by an English translation of the Golādhyāya of Siddhāntaśiromaṇī by Lancelot Wilkinson revised by Bāpū Deva Śāstri in 1861. Another landmark publication was the edition (and translation into German) of the Rk and the Yajus recensions of the ancient Vedāṅgajyotiṣa (c.1300-1100 BCE), with the commentary of Somākara (c.1350 CE) on the Yajus version, by Albrecht Weber from Berlin in 1862. The other two works which were translated during this period were the Brhatasamhitā of Varāhamihira, which was translated by H. Kern during 1870-75, and the Grahalāghava of Gaṇeśa Daivajña (c.1520) which was published along with the Udāharaṇa of Viśvanātha (c.1600) and a Marathi Translation by K. S. Godbole and V. K. J. Gadre from Bombay in the 1870s.

Source-works in Indian Astronomy and Mathematics Edited/Translated During 1876-2019

We have referred to all the editions and translations that were published during 1800-1875, mainly because they were pioneering efforts, and also because there were indeed so few of them – only about 15 source-works were edited and about 10 translated (two of them only partially) in the entire seventy-five period under consideration. The next seventy-odd years, 1876-1947, indeed saw a substantial increase in the number of source-works edited. This was a period when a number of Indian scholars, most of them from a background of traditional scholarship, but trained also in modern institutions of higher learning (including the new institutions of Sanskritic learning), started playing a leading role in the editing and translating source-works of Indian Astronomy and Mathematics.

The prime mover in the editing of source-works was Sudhākara Dwivedin, a student of Bāpūdeva Śāstri in Varanasi, whose example was soon followed by number scholars in Calcutta, Poona, Trivandrum and other places. During 1878-1910, Sudhākara Dwivedin edited and published more than twenty important texts, often with his own Sanskrit commentary. He also wrote a tract in Sanskrit, Gaṇakataraṛaṅgingī, on the lives of Indian Astronomers and Mathematicians. A really comprehensive history of Indian Astronomy was written in Marathi in 1895 by Sankara Balakrishna Dikshit, who took great pains to look through a large number of manuscripts and books to compile details of the works written by hundreds of Astronomers and Mathematicians from the ancient period to the modern times. Incidentally, Dikshit mentions in his preface that the Aufrecht’s Catalogus Catalogorum contains titles of 2,000 works of Indian Astronomy.

We have looked in detail through the comprehensive bibliographies of Sen, Pingree and Sarma, cited in the last section, to make a preliminary master list of the published translations of the source-works of Indian Astronomy and Mathematics during the last two centuries. We have presented the detailed list in Appendix A. What this list reveals is that while there were only 10 works which were translated during 1800-1875, this number rose to 20 during 1876-1947, and further increased substantially to 66 during 1948-2019. We have not made any detailed survey of the source-works which have been edited during 1876-1947 and 1948-2019. However, from our perusal of these bibliographies and other sources, it seems that the number texts edited during these periods may be estimated to be around 135 and 300 respectively. These summary figures are given in Table 5, and the list of the titles translated is given in Tables 6A, 6B.

21 E. Burgess, Translation of the Sūryasiddhānta with Notes and an Appendix, American Oriental Society, New Haven 1860. This work was first published in 1858 by the Journal of American Oriental Society.
22 Sudhakara Dwivedi, Gaṇakataraṛaṅgingī, Varanasi (1892)

Progress Achieved During 1948-2019 in our Understanding of Indian Astronomy and Mathematics

As we saw, the period 1800-1875 saw several pioneering efforts to study the Indian tradition of Astronomy and Mathematics, but the overall number of source-texts which were edited or translated was indeed miniscule – 15 and 10, respectively, as noted in Table 5. An overview of what had been achieved by modern scholarship during the 19th century was presented by George Thibaut in 1899.24

The next seventy-odd year period 1876-1947 did indeed see a significant increase both in the number of works edited and translated – 135 and 20, respectively, as noted in Table 5. Many more details of the concepts, techniques and achievements of Indian Mathematics had been unravelled by then and these were admirably summarised in the classic Volumes on the History of Hindu Mathematics by Bibhutibhusan Datta and Avadhesh Narayan Singh in the 1930s.25 There is no similar overview of the state of our knowledge on Indian Astronomy in the 1930s – some idea can be had from the translation of Khaõóakhādyaka of Brahmagupta by Prabodhchandra Sengupta26 and his introduction to the 1935 edition of the translation of Sūryasiddhānta by Burgess.27

Compared to the state of our knowledge of Indian Astronomy and Mathematics in the 1940s, it may be said that substantial progress has been achieved in the last seventy years, mainly by the dedicated efforts of a large number scholars in studying, editing, translating and analysing the technical contents (mathematical and astronomical) of a number of important texts. As we noted in Table 5, during the period 1948-2019, it is estimated that nearly 300 source-works have been edited and 66 works have been translated – often with detailed explanatory notes. The impact of these editions/translations could already be seen in the review articles and books written on Indian Astronomy and Mathematics during the 1970s (or thereabout).28

From the list of source-works translated during the period 1948-2019 as given in Appendix A, we can see that they include important works such as the Śulvasūtras, the Baksāli Manuscript and many seminal works of the renowned Astronomers/Mathematicians: Lagadha, Parāśara Sphūjidhvaja, Āryabhaṭa, Varāhamihira, Bhāskara I, Brahmagupta, Devācarya, Śrīdārā, Lalla, Vaṭēśvara, and

28 See, for instance, the following:

since 1997,29 and also in the various articles published in the two premier Indian Journals, of these insights have also been brought out in various books and monographs that have appeared techniques as well as the methodology of the Indian tradition of Astronomy and Mathematics. Many of these insights have also been brought out in various books and monographs that have appeared since 1997,29 and also in the various articles published in the two premier Indian Journals, *Indian Journal of History of Science* (published by the Indian National Academy of Sciences since 1966) and *Gaṇita Bhāratī* (published by the Indian Society of History of Mathematics since 1979).

29 See, for instance, the following:
16. K. Ramasubramanian, M. D. Srinivas and M. S. Sriram, NPTEL Course on *Development of Mathematics in India from Vedic Period to Modern Times*, IIT Madras 2013 (http://nptel.ac.in/courses/111101080/)
V. The Untapped Wealth of Manuscripts on Indian Astronomy and Mathematics: The Way Forward

While the above discussion shows that significant progress has been achieved by the modern scholarship in Indian Astronomy and Mathematics during the last seventy years, the fact of the matter is that there are still many large gaps in our current knowledge of this great tradition. We shall not here go into the details of the various historical periods and the broad areas which need to be investigated in depth. Since this discussion is on the untapped wealth of manuscripts in Indian Astronomy and Mathematics, we have put together a representative list of 190 important source-works which are yet to be edited and published. This list is presented in Appendix B and we may note that, as per the details given in the bibliographies of Pingree and Sarma cited above, manuscripts of these works are listed in various catalogues. This list is only indicative of the huge corpus of important source-works which are perhaps easily locatable, but are yet to be edited and studied.

In conclusion, we would like to emphasise we are as yet far from achieving a comprehensive understanding of the fundamental concepts and techniques, theories and methodologies and even the historical development of Indian Astronomy and Mathematics. This is mainly because:

1. Only 450 (or 5%) of the estimated 9,000 source-texts (which are available in the form of manuscripts) have been edited and published so far.
2. Further, even among the 450 or so published works, only about 96 texts have been seriously studied and explicated via translations and explanatory commentaries with a view to bring out their technical (mathematical-astronomical) content.
3. Most of these editions and studies have been brought out during the last seventy years or so; and this is largely due to the voluntary and dedicated efforts of a number of Indian scholars, as there has been little scope or support for such work in our institutions of higher learning.

There is thus an urgent need to reorient our national priorities and give due importance to the Preservation, Digitization, Listing and Cataloguing, Editing & Publishing, and Promoting Systematic Studies of the large corpus of source-works of the great tradition of Science and Technology in India. Training young scholars for undertaking all these tasks should indeed form an integral part of the courses and research conducted in our institutions of higher learning.
Appendix A: Source-Works of Indian Astronomy and Mathematics which have been Translated

1. Vedāṅgajyotiṣa of Lagadha (c.1300-1100 BCE)
   a. English Translation by Jervis (1836)
